MakeADish pitch: full script

Boeing · Pinya · Jean · about 9–10 minutes

How it's built

- **Spine:** Problem → Why now → Solution → How it works → Competition → Go-to-market → Money → Proof → Ask, told as one story. May is the single character who runs through all three speakers.
- **Handoffs:** each speaker ends on a question the next speaker answers (a re-hook), so attention doesn't drop when the voice changes.
- **Story tools (Kallaway):** a villain ("I give up, let me order"), "but / so" instead of "and then", voicing the audience's objection out loud, and a last line people can repeat.
- **Plain-words rule:** one idea per slide, and end each with a sentence the audience could repeat.

Run of show (about 9–10 min)

Slides	Speaker	Part
1–3	Boeing	Part 1 · The problem
4–6	Pinya	Part 1 · Why now, why us, who
7–9	Boeing	Part 2 · The solution
10–11	Pinya	Part 2 · How it's safe, and why we win
12–18	Jean	Grow, earn, prove, ask

Boeing Part 1 · The problem slides 1–3

SLIDE 1

Hi everyone, we're MakeADish.
Imagine with me for a moment.
It's the end of a long day. You open the fridge. There's food in there.
And you still end up ordering delivery.
We've done it too, more than we'd like to admit.
Let's step into one kitchen, on a normal Tuesday night.

SLIDE 2

7:30 pm, Tuesday. Meet May.
She opens the fridge. Eggs. Long beans. Half a pumpkin.
She stares. Nothing comes to mind.
"I give up," she thinks. "Let me order."

But before she does, she opens LINE and taps **Scan Ingredients.** One photo.
A moment later, MakeADish replies: "I found 6 ingredients. Pumpkin stir-fry with egg. 15 minutes, medium spice, shrimp-free. Want to start?"

And that's when May realises: dinner was in her fridge the whole time. She just couldn't see it.
So the phone goes down, and the knife comes up.

That's the whole idea behind MakeADish.
We don't give May new food. We show her the dinner she already has.

SLIDE 3

Now zoom out. May is not alone.
Picture **27 million** Thai home cooks, each at their own fridge, asking "what should I cook?" every day.
When they can't answer, four things go wrong:
they don't know what fits their fridge,
browsing recipes takes too long,
allergies and spice limits make it harder,
and good ingredients go to waste. That's **86 kilos of food waste per Thai person, every year.**

There are millions of recipes online. Finding one is not the problem.
The problem is finding the one that fits **my fridge, my taste, my allergies, right now.**

So why hasn't anyone solved it? And why can we do it today?
Pinya will tell you.

Pinya Part 1 · Why now, why us, who slides 4–6

SLIDE 4

Thanks, Boeing.
Our goal is simple: help home cooks turn what's in the fridge into a meal in minutes.
We want to reach **5,000 Thai kitchens by 2029.**

Why now? Three things changed.
One, LINE. 56 million Thais use it every month. Nothing to install. We meet cooks in the chat they already open every day.
Two, vision AI got cheap. One photo replaces a typed list. AI costs fell from 20 dollars to 7 cents per million tokens in two years. A free tier is now affordable, even for a student team.
Three, tight wallets. Living costs are high and delivery keeps growing. People want a cheaper way to eat well.

SLIDE 5

You might ask: if it's that obvious, why didn't Cookpad or SuperCook do it?
Because they were built differently.
They need a dish search or a typed list.
Global apps don't have Thai recipes tagged for spice and allergens.
And they make you install an app and type.
We start inside LINE, with one photo. Asking for dinner feels like texting a friend.

SLIDE 6

Who is this for? People like May. Students, condo dwellers, busy cooks.
Today they use delivery or TikTok, which means searching by hand, with nothing made for allergies.

How big is it? Of 67.8 million Thai internet users, about 40% cook at home. About 22 million of those use LINE.
If just 2% pay 99 baht a month, that's roughly **half a billion baht a year.**
But we won't pretend we get all of it. Our realistic first target is **5,300 monthly users**, reached through free channels like students and referrals.
May pays 99 baht a month. Later, grocery partners and food brands can pay too.

That's the opportunity. Now let Boeing show you the product.

Boeing Part 2 · The solution slides 7–9

SLIDE 7

Thanks, Pinya. **Now picture** May's Tuesday night again, this time with MakeADish in her LINE chat.
Scan. Check. Choose. Cook.
In one sentence: in the LINE chat, MakeADish reads one photo of your ingredients and gives you Thai recipes you can cook, **never with an allergen you saved.**

SLIDE 8

Step 1, Scan.
May taps สแกนวัตถุดิบ on the menu at the bottom of LINE.
The bot says "take a photo." She takes one.
Nothing to install.

SLIDE 9

Step 2, Check. AI can miss things, so we never guess in silence.
A card asks "ถูกต้องไหม?", shows the ingredients, and shows May's saved allergy in red.
One tap confirms. Or she edits.

Step 3, Choose. A carousel shows dishes she can cook now first.
Then dishes that are "ขาดอีกนิด", just one or two items missing. Each one has a match percentage.

Step 4, Cook. Missing garlic? She gets safe swaps.
Then cook mode: one big step at a time, with a timer.
She rates the dish and it saves to History.

From open fridge to cooking, without typing a word.

But here's the question we always get: "It's AI. What if it gets it wrong, especially with allergies?"
Pinya will show you why that can't happen.

Pinya Part 2 · How it's safe, and why we win slides 10–11

SLIDE 10

Our answer: we use AI where AI is good, and plain code where mistakes are not allowed.
AI does two jobs. A vision model reads the photo and lists the ingredients. A search model finds real recipes by meaning.
Everything else is normal code: allergy filters, spice filters, match percentage, ranking.
So AI can never override an allergy.
If we don't know a dish's allergen data, we hide the dish.
And May confirms the list herself.
The recipes are real. 31 Thai dishes written by our team, growing to 60–100.

SLIDE 11

Now you might be thinking: "ChatGPT reads photos too, and it's free."
True. It's our biggest threat, and we take it seriously.
But ChatGPT is general-purpose. It doesn't have Thai recipes tagged for spice and allergens. It doesn't remember May's allergy. And it isn't inside the chat Thais already live in.
On this map, Cookpad is Thai-first but dish-based. SuperCook is ingredient-based but global.
We're the only one that's both Thai-first and ingredient-based.
And it's hard to copy, because our tagged recipe set grows with every rating we collect.

So we have the product and the market. The big question is: can it grow and earn money?
Jean will show you.

Jean Grow, earn, prove, ask slides 12–18

SLIDE 12

Thanks, Pinya. We start small, in three steps.
First 10 users: our SIIT classmates and friends who cook in dorms and condos, this month. Our message: "Snap your fridge, get a Thai dish in 30 seconds."
First 100: LINE sharing, referrals, and our own posts. It's free and opens in LINE, and the free tier gives one scan a day.
Next 1,000: people share recipes in LINE groups, family profiles bring in more cooks, and we partner with student clubs, then grocery apps.

SLIDE 13

How do we make money? Simple freemium.
Free: one scan a day, basic matches, saved filters, History.
MakeADish Plus, 99 baht a month: unlimited scans, the "Almost there" shopping list, and picks ranked by your ratings.
99 baht is less than one wasted takeout meal.
Our cost is about 1 cent of a baht per scan. Even heavy users cost under 10 baht a month, so margin is above 85%.
Later, grocery partners pay a commission on the one or two missing items.
One honest note: the 2% paying and the 99 baht price are assumptions. **The pilot will test them.**

SLIDE 14

Does it work? We have early evidence, not final proof.
We interviewed 15 people. Most said the same thing: "*I open the fridge, see eggs and some vegetables, and I just end up ordering food.*"
The product is built and live in LINE on a real database.
We tested 10 fridge photos. Ingredient detection was **78% accurate.** That's below our 85% goal.
But it taught us something: the AI sometimes misses items. So we added the editable check card you just saw.
The pilot will prove five numbers: 60% of scans end with a dish, photo to recipe in under 30 seconds, **zero** allergen violations, 85% detection, and 30% coming back in week one.

SLIDE 15

The plan:
By January 2027, we launch the MVP. We grow from 31 to 100 dishes, cover all 9 allergens, and run the pilot.
By May 2027, we improve the product. That means a "need to buy" group, replies to free-text messages, and ranking by "I cooked this" ratings.
Later, if the pilot works, we add regional cuisines, diet packs (vegetarian, halal, jay), and links to grocery delivery.

SLIDE 16

Here's what we're asking for.
One: 30 to 50 home cooks for a 2–4 week pilot inside LINE. Students and condo dwellers are very welcome.
Two: a Thai food expert to review our dishes and their allergen and spice tags.
Three: an intro to a grocery partner, like Lotus's, Tops or GrabMart, to test the "Almost there" shopping list.

SLIDE 17

Who are we? Seven students: a project manager, two designers, a developer, two data and AI builders, and a pitch lead. We built this end to end.

SLIDE 18

Now imagine next Tuesday.
7:30 pm. May opens the fridge again, and this time she doesn't give up.
Real ingredients. Real recipes. Real you.
So next time you open your fridge, dinner is one photo away.
Thank you.

Delivery tips

- **Slide 2 is the emotional peak.** Slow down and pause after "She just couldn't see it."
- **Don't read the slides.** Say the sentence that matters; the slide holds the detail.
- **Rehearse the handoff lines.** Say the last line, look at the next speaker, and they start straight away.
- **To cut to 5–6 minutes:** drop slide 6's market numbers, slide 13's margin line, and shrink slide 15 to one sentence.

Fix in the deck before presenting

- **Slide 13 footnote vs. the math.** The footnote says "2.5% paying", but the calculation and slide 6 use 2%.
- **Slide 13 break-even.** It says "break-even at ~1,000 paid users", but your own target is about 106 paying users. Judges will spot this. It is left out of the script; reword it or have an answer ready.
- **Slide 16 typo.** "So next time you opens the fridge" should read "you open".
